

ABSTRACT

Cosmetics comprising at least one isoflavone aglycone, particularly genistein and/or daidzein, in a biologically active form as active component which is incorporated into liposomes are effective in the treatment of cellulitis, in the treatment of female or male skin after the climacteric, particularly of female skin after the menopause, for increasing the size and firmness of female breasts, and for whitening the skin. Preferably, said isoflavone aglycones incorporated into liposomes are combined with algal extract.
